CHAPTER 00: Intro

0

1 We're introducing a new feature to our Poly VVX lineup.

2 The Poly VVX 250, 350, and 450 desk phones have the functionality to incorporate Pagination into your device.

3 Pagination is a software solution that adds more lines to your existing device without the need for an expansion module.

4 With this upgrade, physical line keys on your VVX device can each display four additional lines.

5 If you are using a VVX 450, which has four physical line keys, Pagination will allow you to display up to 16 lines.

CHAPTER 01: Getting Started

6 Be sure to work with your Service Provider to enable the Pagination functionality on your VVX device.

7 Pagination can be enabled by adding the following parameter to the configuration file for the phone.

8 You are then able to assign each additional line key function,

9 ...such as BLF, line appearances, and speed dials, as per the standard operating procedures to the phone.

CHAPTER 02: Using the Feature

10 Navigate through the pages on the screen by pressing the "Next" soft key, located on the bottom right hand side of the device.

11 The left and right navigation keys on the directional pad allow you to scroll through the pages.

12 A series of small squares are located at the top of the screen. These squares function as page indicators.

13 A solid white square, indicates the current page being viewed.

A solid red square, indicates that the page has an activity, such as an active call or a call in ringing state.

14 Contact your service provider to add Pagination to your VVX device,

15 ...and take your productivity to the next level.
